## New Hydra-Cell® pumps on display at Achema

Wanner International will unveil two new Hydra-Cell® high performance diaphragm pumps for the first time at Achema 2012 Stand K96, Hall 8.

These new 'T' Series pumps are designed for high-pressure, high flow applications. The T8045 can pump up to 170 litres per minute at 207 bar while the T8030 can output 102 litres per minute at 310 bar.

In line with all Hydra-Cell pumps, they have a seal-less design that eliminates leaks, hazards and the expense associated with seals and packing. They can operate with a closed or blocked suction line and run dry indefinitely without damage, eliminating downtime and repair costs.

The unique multi-diaphragm design is claimed to handle more abrasives with less wear than gear, screw or plunger pumps. The design also enables maintenance of valves and diaphragms to be undertaken easily in the field without the need for heavy lifting capabilities and this facility will be demonstrated on the stand.

Visitors to the stand will see five other working displays that highlight the controllability, accuracy and durability of Hydra-Cell pumps for chemical metering, dosing and injection.
